```

Axios upload multipart/form-data.

This body contains all of the data from the fields we've set up, such as the username. If you'd like to read more about sending HTTP requests with fetch() - read our Using fetch to Send HTTP Requests in JavaScript or Making HTTP Requests in Node.js with node-fetch! To use Axios in your Node projects - you can easily install it via npm: npm install axios OR yarn add axios Alternatively, you can include its CDN directly (or download its files to your local machine) and include the library in your markup as follows: { console.log(res); }.catch(err => { console.log(err); }); Note: Again, you could've set the enctype of the form, or altered the headers with Axios. Various simple (or complex) middleware can be installed on top of it to expand the core functionality, when required. Conclusion In this guide, we've taken a look at the enctype attribute and covered how it works. Multipart/Form-Data is one of the encoding types that allows files to be included in your form data before it's transferred to the server for processing. Installing Axios is a Promise-based (asynchronous) HTTP client, present and used in many Node.js projects! It's quite common to use Axios to send HTTP requests, rather than fetch(). To use Express - we'll want to install it via npm. Alternatively, you can define the type for each individual request, by altering the headers: axios.post("/path/to/api", data, { headers: { "Content-Type": "multipart/form-data" }, }); Or you can just set the enctype attribute in the tag of a specific form, and Axios will simply adopt that form's encoding type: Axios + Express For our example, we will create a simple form with two inputs, one for the user Send the name and other to select a profile image: submit without using Axios - it would allow us to expand the default set of events. Other types of encoding can be used to get different transfers from files: Application / X-WWW-Form-UrlenCoded - Encoding data as a query string - Separate key-value pairs (assigned with =), with symbols such as & Text / Plain - Send data as normal text (without encoding) and is mainly used for debugging, not for production. Backend Express for our backend - the easiest and clean way to run a REST API via Express.js, which takes care of the base plate for setting up a server and management requests - which allows you to Focus on development instead of configuring. For a simple management of files loading with Express, we can use the Middleware Express-Fileupload, easily installable even via NPM: NPM Install Express-Fileupload now, let's start a server and define an endpoint that accepts our Post A / Update-Profile request: Const Express = Request ("Express"); VAR FileUpload = Require ("Express-Fileupload"); CONST APP = EXPRESS (); app.use (fileupload ()); app.use (express.urlencoded ({ Extended: true }); app.post ("/ update-profile ", (REQ, RES) => { LET User = req.body.Name User; Let UserPicture = req.files. UserPicture; Res. Send (" Your User Name is: \$ {username} Image Name Loaded: \$ {userpicture.name} "); }); app.listen (5000, () => { console.log (" Server started on port 5000 "); }); the request (request) passed to the request manager contains the data sent by our form. are a couple of ways to do it, without a clear or distinct "winner" - they are functionally equivalent to demand at the end. However, we can ignore this behavior linking an event listener to the button and preventing default events! Once again, sending AXIOS requests involves Asynchronicity - and we can change our headers and particularly customize the request before sending it. All files will be placed under the file field of the REQ object We can then access the input username through req.body.username and the file uploaded through req.files.UserPicture! Take a look at our practical and practical guide to learning Git, with best practices, the standards accepted by the industry and included the data sheet. Now - We define the endpoint that receives this request and processes it. Finally, we turned a rest API to handle the request and accept the incoming file and other form data. Amazing! When the form is filled in and you click the "Submit" button, the request is forwarded to http://localhost:5000 / endpoint upgrade profile, supporting file upload. Multipart / Form-Date: includes files in a form form. If you would like to read more! about creating rest APIs with node and Express, read our guide to building a rest API with node and Express! Express works very much on its own - but I thought to be minimal out of the box and expandable with middleware. The source code is available on GitHub. GitHub.
